# Chaos vs. Cryptography

Chaos	Cryptography
ergodicity	confusion
sensitivity to initial conditions	diffusion w.r.t. small changes in plaintext
mixing property	
sensitivity to control parameters	diffusion w.r.t. small changes in secret key
complex but Deterministic dynamics	pseudo but deterministic randomness

# Chaos + Cryptography

- Shannon's "Chaos" in his classical security paper (1949):  
"Good mixing transformations are often formed by repeated products of two simple non-commuting operations. Hopf has shown, for example, that pastry dough can be mixed by such a sequence of operations. The dough is first rolled out into a thin slab, then folded over, then rolled, and then folded again, etc."
- Digital "Chaos" existing in traditional ciphers:  
 $(ax + b) \bmod p$ ,  $x^n \bmod p$ , etc.
- **Chaos** + **Cryptography** = **Chaotic Cryptography** ...

# Chaos Synchronization

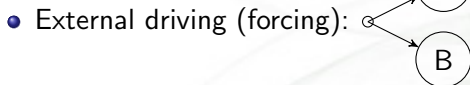

## Definition

*Synchronization of chaos refers to a process wherein two (or many) chaotic systems (either equivalent or nonequivalent) adjust a given property of their motion to a common behavior due to a coupling or to a forcing (periodical or noisy).*

—S. Boccaletta et al. in [*Physics Reports* 366 (2002) 1–101]

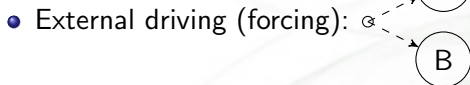

# Chaos Synchronization: Driving Modes

- Internal driving

# Impulsive Driving → Impulsive Synchronization

- Internal driving

# Chaos Synchronization: Directional Driving Case

## Definition

*Given two dynamical systems with different initial conditions, under a driving signal from System 1 (called drive system or master system), System 2 (called response system or slave system) asymptotically follows the state of System 1 in a **certain** sense.*

# Chaos Synchronization: Directional Driving Case

## What does directional synchronization mean?

From information theoretical point of view, the establish of chaos synchronization between two systems means that some information has been successfully transmitted from one side (system 1) to the other (system 2). In other words, this is a communication process!

## What's next?

⇒ By keeping some part secret, we get a secure communication system!

# Chaos Synchronization: Synchronization Modes

- Complete synchronization:  $\mathbf{x}_2(t) \rightarrow \mathbf{x}_1(t)$
- Phase synchronization:  $\phi_2(t) \rightarrow \phi_1(t)$
- Projective synchronization:  $\mathbf{x}_2(t) \rightarrow \alpha \mathbf{x}_1(t)$
- Time-delay synchronization:  $\mathbf{x}_2(t) \rightarrow \mathbf{x}_1(t - \tau)$
- Generalized synchronization:  $\mathbf{x}_2(t) \rightarrow \mathbf{h}(\mathbf{x}_1(t))$
- ...

# Chaotic Masking

# Chaotic Masking: An Example

$$\begin{cases} \dot{x}_1 = a(y_1 - x_1) \\ \dot{y}_1 = cx_1 - x_1z_1 - y_1 \\ \dot{z}_1 = x_1y_1 - bz_1 \end{cases}$$

$\downarrow s(t) = x_1(t) + m(t)$

$$\begin{cases} \dot{x}_2 = a(y_2 - x_2) \\ \dot{y}_2 = cs(t) - s(t)z_2 - y_2 \\ \dot{z}_2 = s(t)y_2 - bz_2 \end{cases}$$

$\Downarrow$

$$\tilde{m}(t) = s(t) - x_2(t) \rightsquigarrow m(t)$$

# Chaotic Switching (Chaotic Shift Keying = CSK)

# Chaotic Switching: An Example

$$\begin{cases} \dot{x}_1^{(0)} = a^{(0)}(y_1^{(0)} - x_1^{(0)}) \\ \dot{y}_1^{(0)} = c^{(0)}x_1^{(0)} - x_1^{(0)}z_1^{(0)} - y_1^{(0)} \\ \dot{z}_1^{(0)} = x_1^{(0)}y_1^{(0)} - b^{(0)}z_1^{(0)} \end{cases} \quad \begin{cases} \dot{x}_1^{(1)} = a^{(1)}(y_1^{(1)} - x_1^{(1)}) \\ \dot{y}_1^{(1)} = c^{(1)}x_1^{(1)} - x_1^{(1)}z_1^{(1)} - y_1^{(1)} \\ \dot{z}_1^{(1)} = x_1^{(1)}y_1^{(1)} - b^{(1)}z_1^{(1)} \end{cases}$$

$$\downarrow s(t) = x_1^{(m(t))}(t)$$

$$\begin{cases} \dot{x}_2 = a^{(0)}(y_2 - x_2) \\ \dot{y}_2 = c^{(0)}s(t) - s(t)z_2 - y_2 \\ \dot{z}_2 = s(t)y_2 - b^{(0)}z_2 \end{cases}$$

$\Downarrow$

$$\tilde{m}(t) = \left\{ \begin{array}{ll} 0, & \int_{\Delta t} |x_2 - s(t)| \leq \varepsilon \\ 1, & \int_{\Delta t} |x_2 - s(t)| > \varepsilon \end{array} \right\} = m(t)$$

# Chaotic Modulation

## Example 1: Chaotic Parameter Modulation

$$\begin{cases} \dot{x}_1 = \frac{1}{C_1}(Gm(t)(-x_1 + y_1) - f(x_1)) \\ \dot{y}_1 = \frac{1}{C_2}(Gm(t)(x_1 - y_1) + z_1) \\ \dot{z}_1 = \frac{1}{L}(-y_1 - R_0z_1) \end{cases}$$

↓  $x_1$

$$\begin{cases} \dot{x}_2 = \frac{1}{C_1}(G\tilde{m}(t)(-x_2 + y_2) - f(x_2) + K_1(x_1 - x_2)) \\ \dot{y}_2 = \frac{1}{C_2}(G\tilde{m}(t)(x_2 - y_2) + z_2 + K_1(x_1 - x_2)) \\ \dot{z}_2 = \frac{1}{L}(-y_2 - R_0z_2 + K_1(x_1 - x_2)) \\ \dot{\tilde{m}}(t) = k_1 \text{sign} \left( \frac{1}{C_1} G(y_2 - x_2) \right) (x_1 - x_2) \end{cases}$$

⇓

$$\tilde{m}(t) \rightsquigarrow m(t)$$

## Example 2: Chaotic Direct (Non-Autonomous) Modulation

$$\begin{cases} \dot{x}_1 = -(y_1 + z_1) = -(x_1 + y_1) + s \\ \dot{y}_1 = x_1 + 0.45y_1 \\ \dot{z}_1 = 2 + z_1(x_1 - 4) + m(t) \end{cases}$$

$$\downarrow s = x_1 - z_1$$

$$\begin{cases} \dot{x}_2 = -(x_2 + y_2) + s \\ \dot{y}_2 = x_2 + 0.45y_2 \\ \dot{z}_2 = 2 + z_2(x_2 - 4) + \tilde{m} \\ \dot{\tilde{m}} = a((x_2 - z_2) - s) = a(\tilde{s} - s) \end{cases}$$

$$\Downarrow$$

$$\tilde{m}(t) \rightsquigarrow m(t) \text{ when } a > 4$$

# Estimation of Carrier Signal

- Valid when  $s(t) = m(t) + x(t)$  (chaotic masking and some modulation schemes).
- Short's NLD (Nonlinear dynamic) forecasting technique [IJBC 1994].
- One of most well-known cryptanalysis tool.
